

Sales & Customer Purchasing Analysis

A five-market performance review of 967,698 dollars in revenue — uncovering the value-vs-volume dynamics, channel behavior, and regional patterns driving quick-service sales from January to May 2026.

MONTHS ANALYZED

From raw transactions to a growth story

This analysis covers **312 transaction records** across **5 cities** (Lisbon, London, Madrid, Berlin, and Paris), **5 product lines**, and **3 payment methods**, spanning January through May 2026. The objective was to move beyond a static sales summary and answer three questions a operations leader actually needs answered: which products truly drive profit, which channels and markets deserve more investment, and where performance is slipping.

\$3,314

AVG. REVENUE / ORDER

January

PEAK REVENUE MONTH

The headline finding: revenue is not distributed the way volume is. A single product — Burgers — generates **47% of all revenue from just 24% of units sold**, while Lisbon alone contributes a third of total revenue, more than three times what the lowest-performing market (Paris) generates. Layered on top, a sharp **26% revenue dip in February** and clearly split payment preferences by city suggest that both operational and marketing strategy should be localized rather than applied uniformly across markets.

The data tells a "value vs. volume" story: the products that move the most units are not the ones paying the bills. Understanding that gap is the difference between optimizing for busy-ness and optimizing for profit.

Methodology & data quality note: The source file was audited before analysis. Categorical fields (Payment Method, Purchase Type) contained inconsistent leading/trailing whitespace (e.g. " Cash" vs "Cash") which was cleaned prior to aggregation to avoid silently under-counting categories. Additionally, 20 Order IDs appeared twice under different timestamps (e.g. Order #10457, logged 12 hours apart with identical line items) — a pattern consistent with duplicate POS submissions that is flagged here for the source system owner rather than silently dropped, preserving transparency in the reported totals.

Burgers are the profit engine, not just a menu item

Comparing each product's share of revenue against its share of units sold reveals which items are true margin drivers versus high-volume traffic builders.

Share of total revenue vs. share of total quantity sold, by product

FINDING

A 2x revenue-to-volume ratio

Burgers account for only 24% of units sold but 47% of total revenue — nearly double their "fair share." At an average price of \$13.23, Burgers sell for roughly 4x the price of Beverages (\$3.43) and Fries (\$3.82), which together make up 58% of units sold but only 31% of revenue.

SO WHAT

Menu strategy implication

Beverages and Fries are likely functioning as traffic-and-attachment items rather than profit centers. This supports a combo/upsell strategy anchored on Burgers, and suggests room to test modest price increases on Chicken Sandwiches (14% of revenue, only 9% of units) without materially denting volume.

Product	Revenue	% of Revenue	Units Sold	% of Units	Avg. Price
Burgers	\$458,804.54	47.4%	34,684	23.9%	\$13.23
Fries	\$159,023.32	16.4%	41,606	28.7%	\$3.82
Beverages	\$146,517.46	15.1%	42,698	29.5%	\$3.43
Chicken Sandwiches	\$138,671.39	14.3%	13,593	9.4%	\$10.20
Sides & Other	\$64,681.36	6.7%	12,283	8.5%	\$5.27

A sharp January-to-February dip, then a slow climb back

Monthly revenue peaked in January before falling 26% in February — the single largest month-over-month swing in the dataset — and has not yet returned to its opening high.

Total monthly revenue, January–May 2026

FINDING

Recovery is real but incomplete

After the February trough (\$166K), revenue climbed for two straight months to an April rebound of \$204K, before easing slightly to \$188K in May. Cumulatively, revenue is up 13% from the February low, but May still sits 16% below the January peak — suggesting January's performance may have been driven by a one-off promotion or seasonal effect that has not been replicated since.

Customers are evenly split across three channels

Online and in-store purchases each represent 39% of revenue, with drive-thru contributing the remaining 22% — meaning 61% of revenue now flows through channels that don't require full in-store dining capacity.

SO WHAT

Omnichannel is already the norm

With online + drive-thru representing 61% of revenue, investment in order-ahead app performance, drive-thru throughput, and delivery packaging quality is likely to move revenue more than in-store dining upgrades.

Lisbon leads by a wide margin — Paris has the most room to grow

Each city is run by a single branch manager, making city-level revenue a direct read on branch performance.

Total revenue by city (branch), Jan–May 2026

FINDING

A 3.2x gap between top and bottom market

Lisbon (managed by Joao Silva) generated \$320,760 — 33% of total revenue — while Paris (Remy Monet) generated just \$100,334. Lisbon also posts the second-highest average order value (\$3,865), pointing to both higher traffic and stronger basket sizes.

SO WHAT

A playbook worth replicating

Rather than treating Paris's gap as a one-off, it's worth auditing whether Lisbon's operating hours, staffing levels, local promotions, or menu mix can be partially replicated in the underperforming market.

Payment preferences are highly localized

Aggregating payment method at the company level would hide a striking pattern: each city has its own dominant way of paying.

Payment method mix as % of revenue, by city

Madrid is almost entirely credit-card driven (98%), while Berlin leans heavily on cash (53%) and gift cards (33%). Paris uses no gift cards at all. These are not random splits — they likely reflect local consumer habits and existing marketing/loyalty programs, and warrant market-specific payment and promotions strategy rather than a one-size-fits-all rollout.

Turning the analysis into a live, filterable tool

Beyond static findings, the underlying dataset was built into an interactive Excel dashboard with manager and city slicers, enabling any stakeholder to drill into a specific branch or team in seconds.

What I would do next with this data

1 Lean into Burgers as the margin anchor

Build combo promotions that pair Burgers with lower-margin Fries/Beverages, and test a modest price increase on Chicken Sandwiches, which already commands a strong per-unit price with room to grow.

2 Investigate the January-to-February revenue cliff

Determine whether January's performance was driven by a specific promotion, pricing change, or seasonal event, and if so, evaluate whether it can be re-run or extended to prevent the post-January drop-off.

3 Audit Lisbon's operating model and pilot it in Paris

With a 3.2x revenue gap between the top and bottom markets, a structured comparison of hours, staffing, local marketing, and menu mix between Lisbon and Paris should surface a short list of testable changes.

4 Tailor payment & loyalty programs by city

Expand gift card promotion in Madrid and Paris, where usage is minimal-to-nonexistent, and ensure reliable card infrastructure in cash-heavy markets like Berlin to avoid friction at checkout.

5 Fix duplicate order logging at the source

Work with the POS/systems team to resolve the duplicate Order ID pattern identified during cleaning, ensuring future transaction-level reporting is fully reliable without manual reconciliation.

Good dashboards show what happened. Good analysis explains why it happened and what to do about it — that gap is where this project focused.
